3. Tebello Mohohoma

GitHub workflow reflection

Initially it was difficult to work as a group using Git/GitHub. This is mainly attributed to the fact that we were new to the language and platform. However, as we progressed, we managed to have a system going which allowed us to effectively work together and progress with the practical. There were situations where some of us lost our commits due to miscommunication within the team.

How we divided the work:

We assigned a team leader who made the final calls, this helped significantly as they managed the pulls which were pushed by other team members ensuring that the code does not have bugs leading to corruption of the main branch.

How changes were integrated:

Each team member created their own branch and worked on their designated section of the code. Then they would push if it was working properly. Once they had completed their tasks, they merged their branch into the main branch. There were no issues with the merging. Once the merging was complete, each team member pushed to the main branch, since they were making minor changes.

Two or three commits:

<< Missing >>

How requests helped:

They ensured that the main branch only contained working code as the pulls were overviewed.
